Description of Product Series

The product range in the ULT 1200 series can be used for collection and filtration of harmful substances and unwanted substances in the form of dusts and gases. Suitable multi-stage filtration systems are available for all industrial applications to deal with different configurations of harmful or unwanted substances.

The harmful and unwanted substances produced in the relevant customer process are collected via collection elements directly at the point of creation and are then filtered by the units in the ULT 1200 series. Through targeted combination of the available individual filters, highest separation rates are achieved. The underlying filtration technology uses particle separation techniques for dusts and

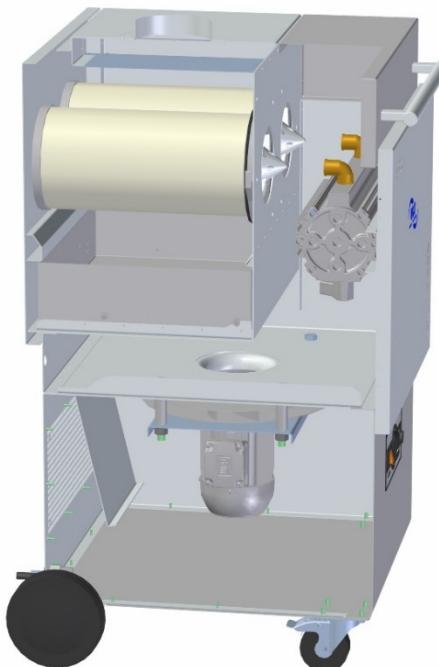

adsorption and chemisorption techniques for gaseous substances

Thanks to the high degree of purification, the filtered clean gas can be directed back to the working space (recirculated air mode). As a result, there are no thermal losses. If recirculated air mode is not desired, an optionally available pipe nozzle can be easily installed to quickly and simply reconfigure the setup so that the outlet air is discharged rather than being fed back in. The filtered clean gas is then directed into an air outlet system.

The units in the ULT 1200 series can be optionally combined with a wide range of accessories. Suitable accessory parts can be selected based on the individual requirements of the customer.

Features ULT 1200 Extraction and Filtration Unit

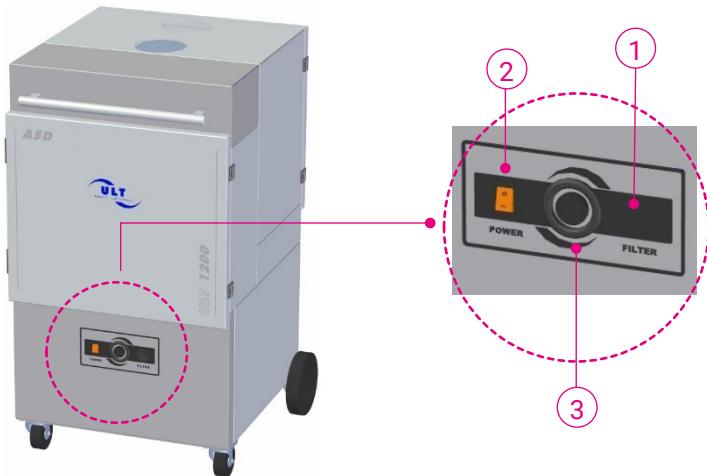

- Mobile unit with casters
- cartridge filter system with automatic cleaning
- 30 l dust collecting bin
- easy filter handling, module construction
- front operating panel
- robust steel housing
- powder coated 7035 light grey, RAL 7001 silver grey

Equipment

ASD Series – Dust and Smoke

Area of application

Grinding | Engraving | Polishing | Filling and Dosing Processes | Restoration

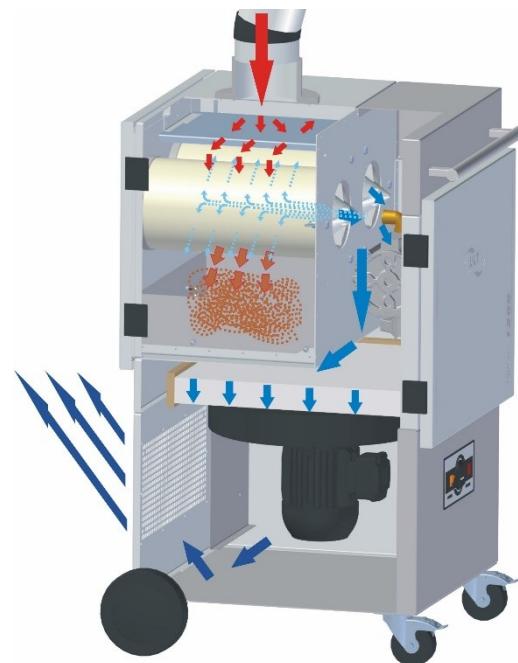

Operating principle

At the clean-air side of the filter, a vacuum generator with a high-pressure reserve produces a volume flow matched to the respective application. This volume flow can be individually and infinitely variably regulated. Thus, the polluted air will be reliably extracted

The **Particles** are captured directly at the place of their origin by appropriate collecting elements and through an applicable piping system the pollutants are carried to the filter elements. To prevent the filter elements from getting worn out in short time they are protected by a baffle plate or a non-return flap at the air intake holding back large particles.

The particles are separated and held back on two **filter cartridges** (nanocoated polyester fibre) by the surface filtration principle. Clogged filter cartridges are automatically and individually treated with rotation air nozzles based on the **counter flow cleaning principle**. The particles blown off fall into collecting bin provided for the removal and disposal of the **filter deposit**.

This excellent filter efficiency makes it possible to recirculate the **filtered air** and reduce energy costs.

Raw gas Filtration Clean gas

Device Variants

ASD 1200 MD. 18 2PA

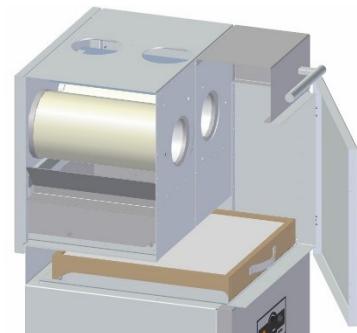

Table 2: ASD 1200 MD. 18 2Pa

Part number/ complete unit:	1-00040
Filter configuration for dust and smoke	complete filter set 4-00167
(1) Filter cartridges 2x	
Filter material:	Polyester fiber
Filter class:	filter cartridges of dust class M according to DIN EN 60335-2-69
Total surface: 9m ² (2 x 4,5m ²)	

Table 3: ASD 1200 MD.18 2Pa (optional filter configuration, only one version possible)

Part number/ complete unit:	9-00094
Post-filter for gases and vapors	
Front insert for post filter	
(1) Adsorption filter cassette A8	
Filter medium:	Activated carbon – Filter (8 kg)
Part number/ complete unit:	9-00095
Post-filter for suspended particulates	
Front insert for post filter	
(1) Particle filter cassette H13	
Filter class:	HEPA filter according to DIN EN 1822
